Instruction

The @import keyword can be used to import external stylesheets and webfonts easily from a local path on disk or a URL (using the url() function). In this exercise, a continuation from the previous exercise, you'll import the Oswald font from a URL (Google Fonts) instead of reading the file off disk.

1. Open the src/styles.css file. You'll notice some base styles. Our first task is to import the Oswald font from Google Fonts. This can be done by using the @import keyword with the url() function. Place the following statement on the very first line of your stylesheet.

```css
@import url('https://fonts.googleapis.com/css?family=Oswald&display=swap');
```

2. The above statement brings the Oswald font into the scope of your stylesheet, following which you can assign it to the h2 and p elements on the page by adding the following ruleset.

```css
h2,
p {
  font-family: 'Oswald', sans-serif;
}
```

3. In the same fashion, the @import keyword can be used to import external stylesheets.
